

Program: RC2Block v.1.0

By: Andrea Andreetti

Date: January 2009

What is RC2Block ? (RevCloud to Block)

RC2Block allow user to convert the selected Revcloud entity by a block who will be inserted on each bulge of this revcloud.

How it work ? :

-Load the RC2Cloud.lsp file with the AutoCAD "_appload" command.

-Run this line : (**RC2Block "YourBlockName" 4**)

RC2Block is the function.

"YourBlockName" is your block name to insert.

Note : Your block must have 1 as width value.

4 is the incremental color change for each inserted block. If you dont need to have color change, put this value to **NIL**.

Note : the colors change will affect only entities set to « Color ByBlock »

Enjoy !
